

# BioHaven's Floating Islands

Floating Islands also known as BioHaven Floating Islands use Biomimicry to address many of today's water quality issues. Constructed from recycled PET plastics, BioHaven's Floating Islands remove excess nutrients in urban and agricultural runoff, treat and polish municipal sewage, remove heavy metals in storm water and mine drainage sites. They also restore wildlife habitat and can be part of riparian edge restoration along rivers. In addition they beautify and enhance any setting.
